- 3.1 The model
- 3.2 Supersymmetric partner
- 4. References

For solvable quantum system with Hamiltonian H_0 having discrete energy energy spectrum (finite or infinite), we get **ladder operators** such that

$$a\psi_n(x) = \sqrt{k(n)}\psi_{n-1}(x), \quad a^{\dagger}\psi_n(x) = \sqrt{k(n+1)}\psi_{n+1}(x).$$

It leads to a generalized Heisenberg algebra $(N\psi_n(x) \equiv n\psi_n(x))$:

$$[a, N] = a, \quad [a^{\dagger}, N] = -a^{\dagger}, \quad [a, a^{\dagger}] = k(N+1) - k(N),$$

Different choices of k(n):

- linearized: k(n) = n;
- factorization of H_0 : $k(n) = \mathcal{E}(n)$, where $\mathcal{E}(n)$ is the shifted energy $(\mathcal{E}(0) = 0)$.

Different definitions of **coherent states** (equivalent for HO case): -Eigenstates of *a*:

$$a\Psi_{\mathsf{Ge}}(z;x)=z\Psi_{\mathsf{Ge}}(z;x);$$

- Action of a displacement operator D(z):

$$D(z)\psi_0(x) = \exp(za^{\dagger} - z^*a)\psi_0(x) = \Psi_{\mathsf{Ge}}(z;x);$$

- Minimum Heisenberg Uncertainty Relation:

$$\sigma_x \sigma_p = \frac{1}{2}, \quad \sigma_x^2 = \langle x^2 \rangle - \langle x \rangle^2.$$

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

- Gaussian states: $(\phi_0, n_0 \ge 0 \text{ and } \sigma_0 > 0 \text{ are real parameters})$

$$\Psi_{\rm G}(n_0,\sigma_0,\phi_0;x,t) = \sum_{n=0}^{\infty} \frac{e^{-\frac{(n-n_0)^2}{4\sigma_0^2} - in\phi_0}}{\sqrt{N_{\rm G}(n_0,\sigma_0)}} e^{-i\omega\mathcal{E}(n)t} \psi_n(x),$$

- First definition of coherent states:

$$\Psi_{\rm Ge}(z;x,t) \equiv \frac{1}{\sqrt{N_{\rm Ge}(z)}} \sum_{n=0}^{\infty} \frac{z^n}{\sqrt{n!}} e^{-i\omega \mathcal{E}(n)t} \psi_n(x).$$

(日) (日) (日) (日) (日) (日) (日) (日)

(equivalence in HO case: $n_0 = z_0 - 1$ and $\sigma_0^2 = z_0/2$, $z_0 = |z|$.)

Starting from a solvable Hamiltonian H_x , a **SUSY partner Hamiltonian** \tilde{H}_x is obtained from the intertwining relations (Q_x and Q_x^{\dagger} are called the intertwining or transformation operators)

$$ilde{\mathcal{H}}_x \mathcal{Q}_x = \mathcal{Q}_x \mathcal{H}_x, \quad \mathcal{Q}_x^\dagger ilde{\mathcal{H}}_x = \mathcal{H}_x \mathcal{Q}_x^\dagger.$$

The intertwining operators can be differential operators in *x* of **any order**.

We will consider in this talk differential operators in x of **second** order.

A particle of mass M is subject to a potential taken to be

$$V(x) = egin{cases} 0, & 0 < x < \pi \ \infty, & ext{otherwise.} \end{cases}$$

The stationary eigenstates and the discrete energies of this system are

$$\psi_n(x) = \sqrt{\frac{2}{\pi}} \sin nx, \qquad E_n = \frac{\hbar^2}{2M} n^2, \quad n = 1, 2, \dots$$

In the following, we will use dimensionless units, setting $\hbar = 1$, M = 1/2, such that the Hamiltonian is $H_x = -\frac{d^2}{dx^2} + V(x)$.

< ロ > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 0 < 0</p>

The GeCS (annihilation eigenstates) can be defined as long as the Hamiltonian H of the system has a non degenerate spectrum and admits a lowest energy equal to zero. We thus work with the shifted Hamiltonian $\mathcal{H} \equiv H - E(0)\mathbb{I}$ instead

of H. It has the same eigenstates as \mathcal{H} and energy eigenvalues are

$$E(n)-E(0)=(n-1)(n+1)\equiv \mathcal{E}(n).$$

We can choose the ladder operators, known as **linearized operators**, such that

$$I\psi_n(x) = \sqrt{n-1} \ \psi_{n-1}(x), \quad I^{\dagger}\psi_n(x) = \sqrt{n} \ \psi_{n+1}(x).$$

The set $\{I, I^{\dagger}, N\}$ thus satisfies the usual Heisenberg algebra:

$$[I, N] = I, \quad [I^{\dagger}, N] = -I^{\dagger}, \quad [I, I^{\dagger}] = 1.$$

A realization of these ladder operators as differential operators of order 1 in x, with dependence in N, is known as:

$$I = \left[N\cos(x) - \sin(x)\frac{d}{dx}\right]\frac{\sqrt{N-1}}{N},$$
$$I^{\dagger} = \frac{\sqrt{N-1}}{N-1}\left[N\cos(x) + \sin(x)\frac{d}{dx}\right].$$

The GeCS can thus be defined as eigenstates of the **linearized annihilation operator**. We will call them **linearized coherent states**(LCS). They take the form, as usual:

$$\Psi_{\mathsf{Ge}}(z;x) \equiv \frac{1}{\sqrt{N_{\mathsf{Ge}}(z)}} \sum_{n=1}^{\infty} \frac{z^{(n-1)}}{\sqrt{(n-1)!}} \psi_n(x).$$

Such choice makes them identical to the displacement operator coherent states (D(z) CS) as in the case of the harmonic oscillator. Indeed, we get

$$D(z)\psi_1(x) = \exp(zl^{\dagger} - z^*l)\psi_1(x) = \Psi_{\mathsf{Ge}}(z;x).$$

Starting from a solvable Hamiltonian $H_x = -\frac{d^2}{dx^2} + V(x)$, a **SUSY** partner Hamiltonian $\tilde{H}_x = -\frac{d^2}{dx^2} + \tilde{V}(x)$ is obtained from the intertwining relations

$$ilde{H}_{\!\scriptscriptstyle X} Q_{\!\scriptscriptstyle X} = Q_{\!\scriptscriptstyle X} H_{\!\scriptscriptstyle X}, \quad Q_{\!\scriptscriptstyle X}^\dagger ilde{H}_{\!\scriptscriptstyle X} = H_{\!\scriptscriptstyle X} Q_{\!\scriptscriptstyle X}^\dagger.$$

Note that when the intertwining operators are differential operators in x of **first order**, we get the SUSY partner as the trigonometric Pöschl-Teller system with $\tilde{V}_1(x) = \frac{2}{\sin^2 x}$.

2. Infinite well, ladder operators and coherent states

2.2. Supersymmetric partners

The new sytem we will work with has been obtained from intertwining operators which are differential operators in x of **second order** in the so called confluent case:

$$Q_x = \frac{d^2}{dx^2} + \eta(x)\frac{d}{dx} + \epsilon + \frac{1}{2}(\eta^2(x) - \eta'(x))$$

and

$$Q^{\dagger}_x=rac{d^2}{dx^2}-\eta(x)rac{d}{dx}+\epsilon+rac{1}{2}(\eta^2(x)-3\eta'(x)),$$

where ϵ is an arbitrary constant. The function $\eta(x)$ satisfies:

$$2\eta(x)\eta''(x) - (\eta'(x))^2 - 4\eta^2(x)\eta'(x) + \eta^4(x) + 4\epsilon \ \eta^2(x) = 0$$

and the new potential is given as

$$\tilde{V}(x) = 2\eta'(x).$$

The resolution of

$$2\eta(x)\eta''(x) - (\eta'(x))^2 - 4\eta^2(x)\eta'(x) + \eta^4(x) + 4\epsilon \ \eta^2(x) = 0$$

leads to admissible solutions for $\epsilon = k^2$ with k = 1, 2, ... We get

$$\eta(x;k,\omega) = \frac{4k\sin^2(kx)}{\sin(2kx) + 2k(\pi\omega - x)},$$

where ω is an arbitrary constant.

The corresponding family of potentials are given as

$$\tilde{V}(x;k,\omega) = \begin{cases} \frac{32k^2 \sin(kx)[\sin(kx)+k(\pi\omega-x)\cos(kx)]}{[\sin(2kx)+2k(\pi\omega-x)]^2}, & 0 < x < \pi\\ \infty, & \text{otherwise.} \end{cases}$$

These potentials are non singular if $\omega \in]-\infty, 0[\cup]1, \infty[$.

2. Infinite well, ladder operators and coherent states

2.2. Supersymmetric partners

Figure 1 - SUSY potential $\tilde{V}(x; k = 1, \omega = 2)$ (left) and $\tilde{V}(x; k = 2, \omega = -0.5)$ (right) as a function of x.

э

The normalised SUSY eigenstates $\tilde{\psi}_n(x)$ are obtained as usual:

$$\widetilde{\psi}_n(x;k,\omega) = (k^2 - E_n)^{-1} Q_x \psi_n(x), \quad (n \neq k).$$

For $n \neq k$, they are physical states, i.e. they are normalisable and such that $\tilde{\psi}_n(0; k, \omega) = \tilde{\psi}_n(\pi; k, \omega) = 0$, since $\eta(0; k, \omega) = \eta(\pi; k, \omega) = 0$. The corresponding energies are $E_n = n^2$ as in the original case. For n = k, we have $Q_x \psi_k(x) = 0$. Solving $Q_x^{\dagger} \psi_k(x) = 0$ and $\tilde{H}_x \psi_k(x) = k^2 \psi_k(x)$, we get

$$ilde{\psi}_k(x;k,\omega) = \sqrt{rac{2}{\pi}}\sin(kx)rac{2\pi k\sqrt{\omega(\omega-1)}}{\sin(2kx)+2k(\pi\omega-x)}.$$

It is normalisable and such that $\tilde{\psi}_k(0, k, \omega) = \tilde{\psi}_k(\pi, k, \omega) = 0$. With this additional state the spectrum of \tilde{H}_x is thus complete.

The annihilation operator of the new system may be written as $L_{S2} = Q_x I Q_x^{\dagger}$. It is now a differential operator in x of order 5. We thus get the action

$$L_{S2}\tilde{\psi}_n(x;k,\omega) = (n^2 - k^2)((n-1)^2 - k^2)\sqrt{n-1}\tilde{\psi}_{n-1}(x;k,\omega).$$

Again, we can use the linearized annihilation operator I_{S2} for which

$$I_{S2}\tilde{\psi}_n(x;k,\omega) = \sqrt{n-1}\tilde{\psi}_{n-1}(x;k,\omega).$$

The associated CS can be defined as eigenstates of the annihilation operator:

$$I_{S2}\tilde{\psi}(x;k,\omega;z)=z\tilde{\psi}(x;k,\omega;z).$$

Since $I_{S2}\tilde{\psi}_k(x;k,\omega) = 0$, we see that

$$I_{S2}\tilde{\psi}(x;k,\omega;z) = \sum_{n=2}^{k-1} c_n(z)\tilde{\psi}_{n-1}(x;k,\omega) + \sum_{n=k+2}^{k-1} c_n(z)\tilde{\psi}_{n-1}(x;k,\omega).$$

It means that the solution of the eigenstate equation for the CS is given by

$$\tilde{\psi}(x;k,\omega;z) = \sum_{n=k+1}^{\infty} c_n(z) \tilde{\psi}_{n-1}(x;k,\omega),$$

where the $c_n(z)$ are determined as usual. The displacement operator $D_{l_{S2}}(z)$ definition of CS will help to recover the missing states. Indeed, $D_{l_{S2}}(z)\tilde{\psi}_k(x;k,\omega) = \tilde{\psi}_k(x;k,\omega)$ and we thus get

$$\tilde{\psi}(x;k,\omega;z) = \sum_{n=2}^{k-1} c_n(z)\tilde{\psi}_{n-1} + c_k\tilde{\psi}_k + \sum_{n=k+1}^{\infty} c_n(z)\tilde{\psi}_{n-1}.$$

3.1. The model

A quantum harmonic oscillator truncated at the origin by an infinite barrier is described by the Hamiltonian $H_0 = -\frac{1}{2}\frac{d^2}{dx^2} + V_0(x)$, where

$$V_0(x) = \begin{cases} \frac{x^2}{2} & \text{if } x > 0\\ \infty & \text{if } x \le 0 \end{cases}$$

,

is the potential of the system.

The energy eigenstates (satisfying the boundary conditions) are known as

$$\psi_k(x) = \left[\sqrt{\pi} \, 4^k (2k+1)!\right]^{-1/2} \, \mathrm{e}^{-x^2/2} \, H_{2k+1}(x) \, .$$

The corresponding eigenvalues are $E_k = 2k + \frac{3}{2}$, k = 0, 1, ...

3.1. The model

Moreover, the natural ladder operators are $l^{\pm} = (a^{\pm})^2$, where a^{\pm} are the ladder operators for the standard harmonic oscillator. We thus get the commutation relations:

$$[H, I^{\pm}] = \pm 2I^{\pm}, \qquad [I^{+}, I^{-}] = 4H$$

and their action on the energy eigenstates is

$$I^-\psi_k(x) = \sqrt{2k(2k+1)}\,\psi_{k-1}(x)\,,\ I^+\psi_{k-1}(x) = \sqrt{2k(2k+1)}\,|\psi_k(x)|\,.$$

3.1. The model

We can again obtain a realization of the ladder operators as a differential operator of order 1 in x. Indeed, introducing the number operator N such that $N\psi_n(x) \equiv n \ \psi_n(x)$ and the fact that $\frac{d^2}{dx^2}\psi_n(x) = (x^2 - 4n - 3)\psi_n(x)$, we get:

$$I^{-} = x \frac{d}{dx} + x^{2} - (2N + 1),$$
$$I^{+} = -x \frac{d}{dx} + x^{2} - (2N + 2),$$

3.2. Supersymmetric partner

After a supersymmetric transformation with Q_x and Q_x^{T} as differential operators in x of second order, we get the supersymmetric partner with potential:

$$V_{\rm S}(x) = rac{x^2}{2} - rac{2\left(16x^8 - 32x^6 + 24x^4 + 72x^2 + 9
ight)}{\left(4x^4 + 3
ight)^2}$$

•

3.2.Supersymmetric partner

The intertwining operators are given by

$$Q_x = \frac{1}{2} \left(\frac{d^2}{dx^2} - \eta \frac{d}{dx} + \gamma \right)$$

and

$$Q_{\mathbf{x}}^{\dagger} = \frac{1}{2} \left(\frac{d^2}{dx^2} - \eta \frac{d}{dx} + \eta' + \gamma \right),$$

with

$$\eta = \frac{2x(4x^4 + 8x^2 + 3)}{4x^4 + 3}, \quad \gamma = \frac{4x^6 + 12x^4 + 27x^2 - 15}{4x^4 + 3}$$

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

3.2. Supersymmetric partner

The level which has been added, below the original ground state $E_0 = 3/2$, is given by $\varepsilon = -5/2$ and the associated eigenfunction is

$$\psi_{\varepsilon_0} = -\frac{2\sqrt{2}e^{-\frac{x^2}{2}}x(2x^2+3)}{\sqrt[4]{\pi}(4x^4+3)}.$$

This is the ground state of $H_{\rm S}$. The eigenfunctions of the excited states are given by

$$\phi_n = \frac{Q\psi_n}{\sqrt{(2n+4)(2n+5)}},$$

3.2. Supersymmetric partner

The annihilation operator of the new system may be written as $L^- = Q_x l^- Q_x^{\dagger}$. It is a differential operator in x of order 5. Let us note that we have

$$L^{-}\phi_{n} = QI^{-}Q^{\dagger}\phi_{n} = k(n)\phi_{n-1}$$

with $k(n) = \sqrt{2n(2n+1)(2n+2)(2n+3)(2n+4)(2n+5)}$. It shows that this annihilation operator cancel both the ground state and the first excited state.

For the construction of the CS, we use again the linearized annihilation operator L_S^- for which

$$L_{S}^{-}\phi_{n}=\sqrt{n}\phi_{n-1}.$$

3.2.Supersymmetric partner

The linearized coherent states of ${\it H}_{\rm S}$ in the isospectral subspace are given by

$$|z\rangle_{\mathrm{iso}} = D_{\mathcal{L}}(z)\phi_0 = \exp\left(-|z|^2\right)\sum_{n=0}^{\infty} \frac{(\sqrt{2}z)^n}{\sqrt{n!}}\phi_n,$$

where the factor $\sqrt{2}$ multiplying the complex parameter z comes from the spacing of 2 in the energy levels. We show some behaviour of those states.

3.2. Supersymmetric partner

3.2. Supersymmetric partner

Now let us study the uncertainty relation.

The expectation value of an operator O when the system is in a coherent state $|z\rangle_{\rm iso}$ is given by

$$\langle z|_{\mathrm{iso}} O|z \rangle_{\mathrm{iso}} = \sum_{m,n=0}^{\infty} \Lambda_{mn}(z) \langle O_{nm} \rangle,$$

where $\Lambda_{m,n}(z) = \exp(-|z|^2) \frac{(\sqrt{2}z)^m(\sqrt{2}z^*)^n}{m!n!}$. It is used to compute the standard deviations of the position and momentum operators $\sigma_x = \sqrt{\langle x^2 \rangle - \langle x \rangle^2}$, $\sigma_p = \sqrt{\langle p^2 \rangle - \langle p \rangle^2}$, and their product $\sigma_x \sigma_p$ as functions of the complex parameter z.

3.2. Supersymmetric partner

4. Conclusion

- Susy partners hamiltonian have been studied in two cases:
- 1) infinite well
- 2) truncated oscillator.
- Linearized ladder operators Q/Q^{\dagger} have been realized as differential operators of order 1 in x with a dependence in N.
- CS have been constructed using the displacement operator action.

4. Conclusion

Figure 6 - Susy infinite well (left) and truncated oscillator (right).

For the infinite well, we see that

$$\tilde{\psi}(x;k,\omega;z) = \sum_{n=2}^{k-1} c_n(z)\tilde{\psi}_{n-1} + \frac{c_k\tilde{\psi}_k}{c_k} + \sum_{\substack{n=k+1\\ \forall n \neq k \neq k}}^{\infty} c_n(z)\tilde{\psi}_{n-1}.$$
