In 1977 Furstenberg gave a beautiful ergodic proof of the well known Szemerédi's theorem.

One of the main steps in the proof is the so-called: multiple ergodic recurrent theorem. This leads the question: Does

$$\frac{1}{N} \sum_{n=0}^{N-1} f_1(T^n x) \dots f_d(T^{dn} x), \quad (1.1)$$

converge in L^2 -norm or a.e.? where (X, \mathcal{B}, μ, T) is a measure preserving transformation, $f_i \in L^\infty$, $1 \leq i \leq d$.

The general form is:

Let Γ be a nilpotent group acting on a probability space (X, \mathcal{X}, μ) and $T_1, T_2, \dots, T_d \in \Gamma$, do the averages

$$\frac{1}{N} \sum_{n=1}^N \prod_{j=1}^k (T_1^{p_{1,j}(n)} T_2^{p_{2,j}(n)} \dots T_d^{p_{d,j}(n)}) f_j$$

always converge in L^2 -norm or a.e. for every $f_1, \dots, f_k \in L^\infty$ and every set of integer valued polynomials $p_{i,j}$?

Remark: it is not true for solvable groups
(Bergelson+Leibman).

In this talk I only focus on the corresponding topological aspects related to the above question.

The way Host-Kra solved the question for a single transformations (L^2 convergence) is that for each $d \in \mathbb{N}$

- For any (X, μ, T) construct a factor Z_d .
- Show that Z_d is a characteristic factor.
- Show that Z_d is an inverse limit of d -step nilsystems (system of order d).

Then a natural question is:

For a minimal system (X, T) , how to define an equivalence relation R (closed, invariant) such that X/R is the maximal factor which is a system of order d ?

Difficulty: (1) Find a suitable definition of R . (2) Show it an equivalence relation. (3) Prove X/R is a system of order d .

Let G be a group. For $g, h \in G$, we write $[g, h] = ghg^{-1}h^{-1}$ for the commutator of g and h and we write $[A, B]$ for the subgroup spanned by $\{[a, b] : a \in A, b \in B\}$.

The commutator subgroups $G_j, j \geq 1$, are defined inductively by setting

$$G_1 = G, \text{ and } G_{j+1} = [G_j, G].$$

Let $k \geq 1$ be an integer. We say that G is k -step nilpotent if $G_{k+1} = \{e_G\}$ is the trivial subgroup.

1. Background

Results and questions

Xiangdong Ye

1. Background

3. High order AA

4. Group-actions

5. Related results

Let G be a k -step nilpotent Lie group and Γ a discrete cocompact subgroup of G . The compact manifold $X = G/\Gamma$ is called a k -step nilmanifold.

The group G acts on X by left translations and we write this action as $(g, x) \mapsto gx$. The Haar measure μ of X is the unique probability measure on X invariant under this action. Let $\tau \in G$ and T be the transformation

$$g\Gamma \mapsto (\tau g)\Gamma, g \in G$$

of X . Then (X, T, μ) is called a k -step nilsystem. When the measure is not needed for results, we omit and write that (X, T) is a k -step nilsystem.

Now return to the 'natural question'. As I said before, it is a hard one.

For $d = 1$, one defined the **regionally proximal relation** Q and showed for a minimal system, it is an equivalence relation, and X/Q is the maximal equicontinuous factor. (Ellis-Gottschalk, Veech, Ellis-Keynes, McMahon).

2. \mathbb{Z} -actions

Now we state the definition of regionally proximal relation of order d introduced by Host-Kra-Maass.

Definition

Let (X, T) be a t.d.s. and let $d \in \mathbb{N}$. The points $x, y \in X$ are said to be **regionally proximal of order d** if for any $\delta > 0$, there exist $x', y' \in X$ and a vector $\mathbf{n} = (n_1, \dots, n_d) \in \mathbb{Z}^d$ such that $\rho(x, x') < \delta$, $\rho(y, y') < \delta$, and

$$\rho(T^{\mathbf{n} \cdot \epsilon} x', T^{\mathbf{n} \cdot \epsilon} y') < \delta$$

for any $\epsilon \in \{0, 1\}^d \setminus \{0, \dots, 0\}$.

The set of all such pairs is denoted by $\mathbf{RP}^{[d]}$, and is called the **regionally proximal relation of order d** .

2. \mathbb{Z} -actions

Results and questions

Xiangdong Ye

Host-Kra-Maass (2010) showed that

Theorem

Let (X, T) be a minimal distal system ^a. Then $\mathbf{RP}^{[d]}$ is an equivalence relation, and $X/\mathbf{RP}^{[d]}$ is the maximal factor of system of order d .

^a (X, T) is distal if for any $x \neq y$, $\inf_{n \in \mathbb{Z}} \rho(T^n x, T^n y) > 0$

- To show $\mathbf{RP}^{[d]}$ is an equivalence relation they passed to \mathbb{Z}^d and \mathbb{Z}^{d+1} actions on $X^{2^d} = X^{[d]}$.
- To prove $X/\mathbf{RP}^{[d]}$ is the maximal factor of system of order d they used ergodic method.

2. \mathbb{Z} -actions

Results and
questions

Xiangdong Ye

1. Background

2. \mathbb{Z} -actions

3. High order
AA

4. Group-actions

5. Related
results

Now we introduce $\mathcal{F}^{[d]}$ and $\mathcal{G}^{[d]}$ actions defined by H-K-M.

For $d = 1$, $\mathcal{F}^{[1]}$ is generated by $id \times T$, and thus

$$\mathcal{F}^{[1]} = \{id \times T^n : n \in \mathbb{Z}\},$$

acting on $X^2 = X^{[1]}$.

$\mathcal{G}^{[1]}$ is generated by $\mathcal{F}^{[1]}$ and $T \times T$,

$$\mathcal{G}^{[1]} = \{(T^n, T^{n+n_1}) : n, n_1 \in \mathbb{Z}\}.$$

2. \mathbb{Z} -actions

Results and questions

Xiangdong Ye

1. Background

2. \mathbb{Z} -actions

3. High order AA

4. Group-actions

5. Related results

For $d = 2$, $\mathcal{F}^{[2]}$ is generated by

$$id \times id \times T \times T = id^{[1]} \times T^{[1]}, \quad id \times T \times id \times T = (id \times T)^{[1]}$$

and thus

$$\mathcal{F}^{[2]} = \{(id, T^{n_1}, T^{n_2}, T^{n_1+n_2}) : n_1, n_2 \in \mathbb{Z}\}$$

acting on $X^4 = X^{[2]}$. $\mathcal{G}^{[2]}$ is generated by $\mathcal{F}^{[2]}$ and $T \times T \times T \times T$. Hence

$$\mathcal{G}^{[2]} = \{(T^n, T^{n+n_1}, T^{n+n_2}, T^{n+n_1+n_2}) : n, n_1, n_2 \in \mathbb{Z}\}.$$

2. \mathbb{Z} -actions

Results and questions

Xiangdong Ye

1. Background

1. Background

2. \mathbb{Z} -actions

3. High order AA

4. Group-actions

5. Related results

Host-Kra-Maass showed that $(x, y) \in \mathbf{RP}^{[d]}$ if and only if there is $a_* \in X^{2^d-1}$ such that

$$(x, a_*, y, a_*) \in \mathbf{Q}^{[d+1]}(X)$$

for a minimal system.

They showed that for a minimal distal system

- 1 $\mathbf{Q}^{[d]}[x] = \overline{\mathcal{F}^{[d]}}(x^{[d]})$ which is minimal for $\mathcal{F}^{[d]}$.
- 2 $(x, y) \in \mathbf{RP}^{[d]}$ iff $(x, y, \dots, y) \in \overline{\mathcal{F}^{[d+1]}}(x^{[d+1]})$.
- 3 $\mathbf{RP}^{[d]}$ is an equivalence relation.

2. \mathbb{Z} -actions

Results and questions

Xiangdong Ye

1. Background

2. \mathbb{Z} -actions

3. High order AA

4. Group-actions

5. Related results

For a general minimal system (X, T) , Shao-Ye (2012) showed

- ① $(\overline{\mathcal{F}^{[d]}}(x^{[d]}), \mathcal{F}^{[d]})$ is minimal for any $x \in X$.
- ② $(\overline{\mathcal{F}^{[d]}}(x^{[d]}), \mathcal{F}^{[d]})$ is the unique minimal set in $\mathbf{Q}^{[d]}[x]$.
- ③ $(x, y) \in \mathbf{RP}^{[d]}$ iff $(x, y, \dots, y) \in \overline{\mathcal{F}^{[d+1]}}(x^{[d+1]})$.
- ④ $\mathbf{RP}^{[d]}$ is an equivalence relation.
- ⑤ if $\pi : X \rightarrow Y$ is a factor map, then $\pi \times \pi(\mathbf{RP}^{[d]}(X)) = \mathbf{RP}^{[d]}(Y)$.

By (5) and Host-Kra-Maass we know that $X/\mathbf{RP}^{[d]}$ is the maximal factor of system of order d .

4. Group-actions

5. Related results

Now we present a recent result by Glasner-Gutman-Ye.

Let G be a group and (X, G) be minimal. Assume that G is abelian. For $d = 2$, $\mathcal{F}^{[2]}$ is generated

$$id \times id \times h_2 \times h_2, \quad id \times h_1 \times id \times h_1, \quad h_1, h_2 \in G.$$

Thus,

$$\mathcal{F}^{[2]} = \{(id, h_1, h_2, h_1 h_2) : h_1, h_2 \in G\}.$$

$\mathcal{G}^{[2]}$ is generated by $\mathcal{F}^{[2]}$ and $h \times h \times h \times h$, $h \in G$. Hence

$$\mathcal{G}^{[2]} = \{(h, hh_1, hh_2, hh_1 h_2) : h, h_1, h_2 \in G\}.$$

The proof of Shao-Ye works similarly.

4. Group-actions

Results and questions

Xiangdong Ye

1. Background

2. \mathbb{Z} -actions

3. High order AA

4. Group-actions

5. Related results

For a general group, and $d = 2$, $\mathcal{F}^{[2]}$ is generated by

$$id \times id \times h \times h, \quad id \times t \times id \times t, \quad t, s \in G.$$

Thus

$$\mathcal{F}^{[2]} = \{(id, t_1 \cdots t_l, h_1 \cdots h_j, t_1 h_1 \cdots t_l h_l) : t_l, h_l \in G, l \in \mathbb{N}\}.$$

$\mathcal{G}^{[2]}$ is generated by $\mathcal{F}^{[2]}$ and $\Delta_2 =: \{h \times h \times h \times h : h \in G\}$.

We may define $\mathcal{F}^{[d]}$ and $\mathcal{G}^{[d]}$ similarly. We have that:

$$\mathcal{G}^{[d]} = \mathcal{F}^{[d]} \Delta_d.$$

Theorem (GGY)

When G is compactly generated, $X/\mathbf{NRP}^{[d]}$ is a system of order d (or pro-nilsystem of order d). (lifting property+ Gutman-Manners-Varju's work for a minimal distal system).

- Host-Kra-Maass used ergodic method for \mathbb{Z} -actions.
- Gutman-Manners-Varju used topological and combinatorial method with more details for the former work by Camarena and Szegedy.
- For $d = 1$, $X/\mathbf{NRP}^{[1]}$ is the maximal abelian factor.

4. Group-actions

5. Related results

Let (X, G) be minimal. In fact we also have

- 1 There is a dense G_δ subset X_0 of X such that for each $x \in X_0$, $\mathbf{Q}^{[d]}[x] = \overline{\mathcal{F}^{[d]}(x^{[d]})}$. (This is new even for \mathbb{Z} -actions).

There is an example (Tu-Ye, 2013) for some $x \in X$, $\mathbf{Q}^{[d]}[x] \neq \overline{\mathcal{F}^{[d]}(x^{[d]})}$.

- 2 If in addition (X, G) is distal, then $\mathbf{Q}^{[d]}[x] = \overline{\mathcal{F}^{[d]}(x^{[d]})}$ which is minimal under $\mathcal{F}^{[d]}$ for any $x \in X$.

We can define another relation.

Definition

Let G be a group and (X, G) be a t.d.s. $(x, y) \in \mathbf{RP}^{[d]}$ if for any $\epsilon > 0$ and for any neighborhood $U \times V$ of (x, y) there are $(x', y') \in U \times V$ and $F = (id, F_1, \dots, F_{2^d-1}) \in \mathcal{F}^{[d]}$ such that

$$\rho(F_i x', F_i y') < \epsilon, \quad 1 \leq i \leq 2^d - 1.$$

It is not hard to show that

$$\mathbf{RP}^{[d]} \subset \mathbf{NRP}^{[d]}.$$

Again if G is abelian, then $\mathbf{RP}^{[d]} = \mathbf{NRP}^{[d]}$ by Shao-Ye. The open question is

Question (Glasner-Gutman-Ye)

Let (X, G) be minimal. For which G we have $\mathbf{RP}^{[d]}$ is an equivalence relation?

We remark that when G is a finite non-abelian group, the for the minimal system (G, G) ,

$$\{(g, g) : g \in G\} = \mathbf{RP}^{[1]} \neq \mathbf{NRP}^{[1]}.$$

4. Group-actions

5. Related results

We guess that $\mathbf{RP}^{[d]}$ is an equivalence relation when G is amenable or G has the property that $(X \times X, G)$ has a dense set of minimal points (this is true when $d = 1$).

It is a very interesting question to determine the structure $X/\mathbf{RP}^{[d]}$ when $\mathbf{RP}^{[d]}$ is an equivalence relation for a non-abelian group G .

Theorem

Let (X, T) be weakly mixing and minimal. Then there is $x \in X$ such that

$$\{T^{n^2}x : n \in \mathbb{Z}\}$$

is dense in X .

In fact it is a special case proved by Huang-Shao-Ye (2016) for nilpotent minimal weakly mixing actions.

Condition *:

Let (X, Γ) be a topological system, where Γ is a nilpotent group such that for each $T \in \Gamma$, $T \neq e_\Gamma$, is weakly mixing and minimal. For $d, k \in \mathbb{N}$ let $T_1, \dots, T_d \in \Gamma$, $\{p_{i,j}(n)\}_{1 \leq i \leq k, 1 \leq j \leq d} \in \mathcal{P}_0$ such that the expression

$$g_i(n) = T_1^{p_{i,1}(n)} \dots T_d^{p_{i,d}(n)}$$

depends nontrivially on n for $i = 1, 2, \dots, k$, and for all $i \neq j \in \{1, 2, \dots, k\}$ the expressions $g_i(n)g_j(n)^{-1}$ depend nontrivially on n .

The following question is still open.

Question (Bergelsen)

Let (X, T) be *totally minimal*^a. Is there an $x \in X$ such that

$$\{T^{n^2}(x) : n \in \mathbb{Z}\}$$

is dense in X ?

^a (X, T) is totally minimal if (X, T^n) is minimal for $n \neq 0$.

Bergelson and Leibman(1996), Leibman (2005).

5. Related results

Now we consider a relation, denoted by \mathbf{AP}^d .

Definition

Let (X, T) be a t.d.s. and $d \in \mathbb{N}$. We say $(x, y) \in X \times X$ is a regionally proximal pair of order d along arithmetic progressions if for each $\delta > 0$ there exist $x', y' \in X$ and $n \in \mathbb{Z}$ such that $\rho(x, x') < \delta$, $\rho(y, y') < \delta$ and

$$\rho(T^{in}(x'), T^{in}(y')) < \delta \text{ for each } 1 \leq i \leq d.$$

The set of all such pairs is denoted by $\mathbf{AP}^{[d]}(X)$ and is called the regionally proximal relation of order d along arithmetic progressions.

We only have some partial results.

Theorem

Let (X, T) be a unique ergodic minimal distal system such that for each $d \geq 1$, Z_d is isomorphic to X_d . Then for $d \geq 1$, $\mathbf{AP}^{[d]} = \mathbf{RP}^{[d]}$.

Consequently, for a minimal ∞ -nilsystem, we have for $d \geq 1$, $\mathbf{AP}^{[d]} = \mathbf{RP}^{[d]}$.

Question (Huang-Shao-Ye)

Is it true that for a minimal distal system, we have for $d \geq 1$, $\mathbf{AP}^{[d]} = \mathbf{RP}^{[d]}$?
