# 1.1. Archimedean survival copula

### A survival copula is defined as

$$C(u_1,...,u_n) = P(U_1 > 1 - u_1,...,U_n > 1 - u_n),$$

where  $U_1, \ldots, U_n$  are *n* (dependent) uniforms on (0, 1).

Such a copula is Archimedean if

$$C(u_1,\ldots,u_n)=\psi(\psi^{-1}(u_1)+\ldots+\psi^{-1}(u_n))$$

for some univariate survival function  $\psi$  (called Archimedean generator).

A survival function  $\psi$  may be an Archimedean generator iff  $\psi$  is a n-monotone function.

### Definition.

 $(X_1, \ldots, X_n)$  forms a Schur-constant model if

$$P(X_1 > x_1, \ldots, X_n > x_n) = S(x_1 + \ldots + x_n),$$

for some univariate survival function S (called Schur-constant).

・ロト ・ 理 ト ・ ヨ ト ・

1.1. Archimedean survival copula1.2. Schur-constant model1.3. Schur-constant versus Archimede

The model is a special case of exchangeable vector.

All the lower dimensional subvectors of  $(X_1, \ldots, X_n)$  are also Schur-constant.

The model translates a property of *indifference relative to aging* -or no-aging-:

$$X_i - x_i | (\mathbf{X} > \mathbf{x}) =_d X_j - x_j | (\mathbf{X} > \mathbf{x}).$$

The function *S* is both Schur-convex and Schur-concave, hence the appellation of Schur-constant.

<ロ> <同> <同> <同> <同> <同> <同> <同> <

Preliminaries: the continuous case

 Discrete Schur-constancy
 Monotone survival functions

 Schur-constant interarrival models
 Schur-constant versus

#### Characterization 1.

A survival function S may be a Schur-constant generator iff S is a n-monotone function.

S can then be written as

$$S(x) = E\left(1-\frac{x}{Z}\right)_+^{n-1},$$

where  $Z =_d X_1 + \ldots + X_n$ . And reciprocally.

Thus, a Schur-constant model is such that

$$P(X_1 > x_1, ..., X_n > x_n) = E\left(1 - \frac{x_1 + ... + x_n}{Z}\right)_+^{n-1}$$

  - 3. Monotone survival functions
- 4. Schur-constant interarrival models

1.1. Archimedean survival copula1.2. Schur-constant model1.3. Schur constant vorgun Archimedea

### Characterization 2.

A Schur-constant model has the radial representation

$$\begin{bmatrix} X_1 \\ X_2 \\ \vdots \\ X_n \end{bmatrix} =_d Z \begin{bmatrix} U_1 \\ U_2 \\ \vdots \\ U_n \end{bmatrix}$$

where

- \* Z is independent of the  $U_i$ 's, and
- \*  $(U_1, \ldots, U_n)$  is a Schur-constant vector of sum 1 with

$$P(U_1 > u_1, \ldots, U_n > u_n) = [1 - (u_1 + \ldots + u_n)]_+^{n-1}$$

- 3. Monotone survival functions
- 4. Schur-constant interarrival models
- 1.1. Archimedean survival copula
- 1.2. Schur-constant model
- 1.3. Schur-constant versus Archimedean

### 1.3. Schur-constant versus Archimedean

Schur-constant models and Archimedean copulas are closely related. Indeed:

(i) The copula of a Schur-constant model of generator S is Archimedean with the same generator S.

(ii) If  $(U_1, \ldots, U_n)$  form a Archimedean copula of generator  $\psi$ , then  $[\psi^{-1}(1 - U_1), \ldots, \psi^{-1}(1 - U_n)]$  forms a Schur-constant model with the same generator  $\psi$ .

э

A function  $f(x) : N_0 \rightarrow R$  is said to be *n*-monotone if

$$(-1)^j \Delta^j f(x) \geq 0, \quad j=0,\ldots,n,$$

#### Characterization 1.

A survival function *S* may be a Schur-constant generator iff *S* is a *n*-monotone function on  $N_0$ .

Equivalently, the associated p.m.f. p is a (n-1)-monotone function on  $N_0$ .

<ロ> (四) (四) (三) (三) (三)

2. Discrete Schur-constancy

3. Monotone survival functions

4. Schur-constant interarrival models

2.1. Discrete Schur-constant models 2.2. The special geometric case

.

<ロ> (四) (四) (三) (三) (三)

#### S can then be written as

$$S(x) = E\left[\binom{Z-x+n-1}{n-1}/\binom{Z+n-1}{n-1}
ight],$$

where  $Z =_d X_1 + \ldots + X_n$  with a p.m.f.

$$P(Z=z)=(-1)^n\binom{Z+n-1}{n-1}\Delta^n S(z).$$

Thus, a Schur-constant model is such that

$$P(X_1 \ge x_1, \dots, X_n \ge x_n) = \\E\left[\binom{Z - (x_1 + \dots + x_n) + n - 1}{n - 1} / \binom{Z + n - 1}{n - 1}\right]$$

Preliminaries: the continuous case
 Discrete Schur-constancy
 Monotone survival functions
 Schur-constant interarrival models
 2.1. Discrete Schur-constant models
 2.2. The special geometric case

### Characterization 2.

A Schur-constant model has the 'discrete radial' representation that is of doubly mixed multinomial form, namely

$$(X_1,\ldots,X_n) =_d \mathcal{M}M(Z; U_1,\ldots,U_n),$$

where

\* Z is independent of the  $U_i$ 's, and

\*  $(U_1, \ldots, U_n)$  is a continuous Schur-constant vector of sum 1 with

$$P(U_1 \ge u_1, \ldots, U_n \ge u_n) = [1 - (u_1 + \ldots + u_n)]_+^{n-1}.$$

# 4.1. Claim counting process

We introduce an associated counting process as

$$N(t) = \sum_{i=1}^{n} I(T_i \leq t), \quad t \in N,$$

where  $T_i = X_1 + \ldots + X_i$  and  $\{X_1, \ldots, X_n\}$  is Schur-constant.

In insurance, suppose that a maximum number of *n* claims can arise in a portfolio. Let  $T_i$  denote the claim arrival time of the *i*-th claim. Then, N(t) represents the total number of claims that occur until time *t*.

4.3. Insurance risk process

### Property 1.

(1) For  $t \ge 0$ ,  $P[N(t) = n] = P(T_n \le t)$ , with  $T_n =_d Z$ ,  $P[N(t) = k] = (-1)^k \Delta^k S(t+1) {t+k \choose k}$ ,  $0 \le k \le n-1$ .

(2) For  $0 \leq t_1 \leq \ldots \leq t_k \leq t$ ,

$$P[T_1 = t_1, \ldots, T_k = t_k | N(t) = k] = 1/\binom{t+k}{k}, \ 1 \le k \le n-1.$$

(Given N(t) = k, the arrival times are obtained by throwing k undistinguishible balls in t + 1 urns (the instants  $0, \ldots, t$ )).

# 4.2. Random payment process

A compound Schur-constant sum of discounted claims:

$$R(t) = \sum_{i=1}^{N(t)} C_i \prod_{j=1}^{T_i} v_j = \sum_{i=1}^n I(T_i \leq t) C_i \prod_{j=1}^{T_i} v_j, \quad t \in N,$$

where  $T_i = X_1 + ... + X_i$  is the *i*-th payment time,  $C_i$  is the claim amount at  $T_i$ , independent of the payment times, and  $v_j$  is a deterministic discount factor for the period (j - 1, j).

Our purpose is to determine the Laplace transform of R(t), in terms of the Laplace transform of  $C_i$ .
