# nonequilibrium states with temperature inversion in long-range interacting systems

## Lapo Casetti

Dipartimento di Fisica e Astronomia, Università di Firenze, Italy INFN, sezione di Firenze, Italy INAF-Osservatorio di Arcetri, Italy

collisionless Boltzmann (Vlasov) equation and modeling of self-gravitating systems and plasmas

CIRM Marseille, October 31, 2017

joint work with Pierfrancesco Di Cintio, Shamik Gupta, and Tarcísio N. Teles

LC & Gupta European Physical Journal B 87, 91 (2014) Teles, Gupta, Di Cintio & LC Physical Review E 92, 020101(R) (2015) Teles, Gupta, Di Cintio & LC Physical Review E 93, 066102 (2016) Gupta & LC New Journal of Physics 18, 103051 (2016) Di Cintio, Gupta & LC arXiv:1706.01955, MNRAS (submitted, 2017)

# introduction & motivation

## • temperature inversion

- nonequilibrium states with anticorrelation between density & temperature the sparser the hotter, the denser the colder
- observed at astrophysical scales

solar corona, filaments in molecular clouds, (some) cD galaxies, hot gas in galaxy clusters...

## • "universal" phenomenon?

- from a simple idea... velocity filtration
- ...to a toy model...

the Hamiltonian Mean Field (HMF) model

• ...and beyond toy models...

from astrophysical to atomic scales:

filaments in molecular clouds (2d self-gravity) and atoms in a cavity (mean-field dynamics)

• ...to a physical picture

minimal ingredients: long-range interactions & inhomogeneous states

basic physical mechanism: interplay between spatial inhomogeneity & wave-particle interaction

# temperature inversion

temperature  $\propto$  locally averaged kinetic energy  $\propto$  squared velocity dispersion

temperature inversion	velocity filtration	toy model 000	kick & quench 000	astro to atoms 00000	physical picture	summary

## temperature inversion

- → many examples in astrophysical systems
  - the "classic" example: the solar corona temperature rises from 10<sup>3</sup> to 10<sup>6</sup> K while density drops by eight orders of magnitude
  - filaments in molecular clouds clear measurements for dust, only indirect evidence for gas yet [Palmeirim *et al.* 2013; Toci & Galli 2015]
  - dense cores in molecular clouds
     velocity dispersion measurements [Goodman et al. 1998; Padoan et al. 2001; Pineda et al. 2010]
  - cool cores in galaxy clusters gas
     [Wise et al. 2004]
  - plasma torus around Jupiter's moon lo [Meyer-Vernet et al. 1993, 1995; Saur et al. 2004]
  - some cD galaxies

velocity dispersion profile of NGC 3311 in Hydra [Loubser et al. 2008]

 $\rightarrow$  very different systems and energy/length scales...treated as unrelated phenomena

(日) (日) (日) (日) (日) (日) (日) (日)

 $\rightarrow$  some basic physics in common?

	temperature inversion	velocity filtration	toy model 000	kick & quench 000	astro to atoms 00000	physical picture	summary
velocity filtration							

#### 1990s: J. D. Scudder to explain coronal heating [J. D. Scudder, ApJ 1992 & 1994]

...without great success in the solar physics community...

1990s: J. D. Scudder to explain coronal heating [J. D. Scudder, ApJ 1992 & 1994]

...without great success in the solar physics community...

## Scudder model

- noninteracting particles in an external field, e.g. gravity one dimension: x height above ground
- stationary boundary condition at x = 0

collisionless Boltzmann equation for f(x, p, t)

$$\frac{\partial \mathbf{f}}{\partial t} + p \frac{\partial \mathbf{f}}{\partial x} - \frac{d\psi}{dx} \frac{\partial \mathbf{f}}{\partial p} = 0$$

... just single-particle energy conservation in this case...

## velocity filtration

only particles with kinetic energy  $k(0) \ge \psi(x)$  reach x where  $k(x) = k(0) - \psi(x)$ 

・ロト ・聞 ・ ・ 画 ト ・ 画 ・ うらの

# velocity filtration thermal boundary condition

thermal boundary condition (Maxwellian) from now on  $k_B = 1$ 

$$f_0^{M}(p) = \frac{n_0}{\left(2\pi T_0\right)^{1/2}} \exp\left(-\frac{p^2}{2T_0}\right) \implies f(x,p) = \exp\left[-\frac{\psi(x)}{T_0}\right] f_0^{M}(p) \implies T(x) \equiv T_0$$

**only** with thermal boundary condition  $f_0^M$ 

▲□▶ ▲圖▶ ▲厘▶

3.0

plot  $\ln f$  as a function of (signed) kinetic energy k

# velocity filtration how does it work?

rescale f with n

# velocity filtration suprathermal boundary condition

suprathermal  $f_0$ , i.e., with tails fatter than a Maxwellian

$$f_0(p) = \frac{\sqrt{2}}{\pi \left(1 + p^4\right)}$$

intro temperature inversion velocity filtration ooo toy model kick & quench astro to atoms physical picture summary ooo

# velocity filtration summary

#### pros

- simple and general mechanism for temperature inversion
- needs no active energy injection in sparser regions of the system
- makes no use of specific ingredients (magnetic fields, turbulence,...)

▲ロト ▲周ト ▲ヨト ▲ヨト 三日 - のくぐ

intro temperature inversion velocity filtration toy model kick & quench astro to atoms physical picture summary 000 000 000 0000 00000 00

# velocity filtration summary

#### pros

- simple and general mechanism for temperature inversion
- needs no active energy injection in sparser regions of the system
- makes no use of specific ingredients (magnetic fields, turbulence,...)

#### cons

- what about interactions?
- needs a non-thermal boundary condition for all times a very strong assumption, seems to rule out isolated systems
- who keeps the system in a non-thermal state at the boundary? still an ad hoc "active" ingredient

## wave-particle interaction

- the perturbation induces a wave in the system after the kick the system gains energy and *m* oscillates a cold collapse starts with virial oscillations
- the wave is damped and the system settles in a QSS how can it be? no collisions!
- wave-particle interactions! (Landau damping) particles interact with the oscillating mean field
- wave-particle interactions ≈ selective in velocity interaction ≈ locally changes f(v) after the kick let's check it...

# wave-particle interaction

cumulative momentum distribution f(p) as a function of time (\* t = 0)
