1. Introduction

Motivation:

- The considerations on admissibility and invariance of designs are key to reduction of complicated design problems.
- These concepts are addressed in detail and applied successfully for finding optimal designs in single-response models

$$y_i = \eta(x_i, \theta) + \varepsilon, \quad i = 1, 2, ..., n.$$

Purpose of the present study:

To extend the considerations on admissibility and invariance to multiresponse designs.

Multiresponse experiments:

- In a multiresponse situation, several responses are considered simultaneously, which are usually correlated.
- Data on more than one response variable is recorded from the same experimental unit through application of same treatment.
- They occur in, e.g., engineering, pharmaceutical, biomedical, environmental research.

Example 3. Parallel linear model

Huang, Chen, Lin and Wong (2006)

$$\begin{cases} y_1(x) = \theta_{01} + \theta_1 x_1 + \varepsilon_1, \\ y_2(x) = \theta_{02} + \theta_1 x_2 + \varepsilon_2, \end{cases} \Sigma = \begin{pmatrix} 1 & \rho \\ \rho & 1 \end{pmatrix}$$
(2.10)
where $x = (x_1, x_2) \in \mathcal{X} = [-1, 1] \times [-1, 1]$.
 $f_1(x) = (1, 0, x_1)^T$
 $f_2(x) = (0, 1, x_2)^T$
 $\theta = (\theta_{01}, \theta_{02}, \theta_1)^T$

Definition of an optimality criterion:

A criterion is a nonnegative function $\phi:\mathsf{NND}(s)\to\mathbb{R}$

that is isotonic relative to the Loewner ordering, positively homogeneous and superadditive.

• Isotonic relative to the Loewner ordering: $A \ge B > 0 \quad \rightarrow \quad \phi(A) \ge \phi(B).$

• Positive homogeneity:

 $\phi(\delta A) = \delta \phi(A) \quad \forall \delta > 0, \; \forall A \in \mathsf{NND}(s).$

• Superadditivity:

 $\phi(A+B) \ge \phi(A) + \phi(B) \quad \forall A, B \in \mathsf{NND}(s).$

Lemma 1. Let

$$L_T: \operatorname{NND}(k) \to \operatorname{Sym}(p)$$

 $L_T(A) = L^T(T \otimes A)L$

for a given $rk \times p$ matrix L with rank(L) = p, and a positive definite matrix T of order r. Assume Q to be a subgroup of GL(k). Define $N_Q = I_r \otimes Q$ and

$$\mathcal{N}_{\mathcal{Q}} = \{ N_Q \mid Q \in \mathcal{Q} \}.$$

We then have the following claims:

Introduction

Multirespons model

Admissibility o designs

Invariance of designs

Elfving's theorem for D-optimality

Concludin remarks

References

a. (Equivariance) There exists a group homomorphism $H: \mathcal{Q} \to GL(k)$ such that L_T is equivariant under H,

$$L_T(QAQ^T) = H(Q)L_T(A)H(Q)^T,$$

$$\forall A \in \mathsf{NND}(k), \ Q \in \mathcal{Q},$$

if and only if the range of L is invariant under each transformation $N_O \in \mathcal{N}_Q$,

 $\operatorname{Range}(N_Q^T L) = \operatorname{Range}(L), \quad \forall N_Q \in \mathcal{N}_Q.$

Introduction

Multirespons model
