

Permutation classes are sets of permutations defined by some forbidden subconfigurations. A lot of effort has been put in the past thirty years to enumerate such sets of permutations. More recently, there has been a growing interest into describing large uniform random permutations in a given class. We will in particular focus on an approach via decomposition trees. Analytic combinatorics plays an important role in analyzing such models.

This is joint work with Frédérique Bassino (Paris-Nord), Mathilde Bouvel (Zurich), Lucas Gerin (École Polytechnique), Mickaël Maazoun (ENS de Lyon) and Adeline Pierrot (Orsay).
