Title: The problem of higher nonabelian mixed Hodge structures

Abstract:

We'll look at various aspects desirable for defining a notion of higher nonabelian mixed Hodge structure. This includes the role of weights, and the importance of using derived geometry. Progress has been made by several approaches, yet on the whole this has remained an open question for quite some time. I don't have anything to propose. However, we will be able to look in a little more detail about the moduli of local systems on an open curve, in which weights $0,1,2$ appear.
