Abstract

The consensus among research scientists on anthropogenic global warming has grown to 100%, based on a review of 11,602 peer-reviewed articles on “climate change” and “global warming” published in the first 7 months of 2019.

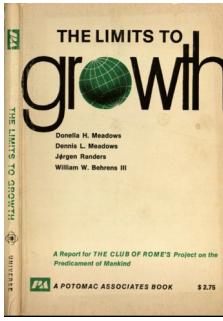

Consequences

Limiting warming to 1.5°C and 2°C involves rapid, deep and in most cases immediate greenhouse gas emission reductions

Net zero CO₂ and net zero GHG emissions can be achieved through strong reductions across all sectors

Adapted from Fig 5 <https://www.ipcc.ch/report/ar6/syr/figures/figure-spm-5>

Rediscovering the 70's

Rediscovering the 70's

Rediscovering the 70's

'Qu'une recherche de pointe soit associée à une véritable menace à la survie de l'humanité, une menace même à la vie tout court sur la planète, ce n'est pas une situation exceptionnelle, c'est une situation qui est de règle. [...]. Je ne veux pas dire par là que la seule cause de tous ces maux, de tous ces dangers, ce soit la science. Il y a bien entendu une conjonction de plusieurs choses ; mais la science, l'état actuel de la recherche scientifique, joue certainement un rôle important.

[...]

Ainsi, depuis un an ou deux, je me pose des questions. Je ne les pose pas seulement à moi-même. Je les pose aussi à des collègues et, tout particulièrement depuis plusieurs mois, six mois peut-être, je profite de toutes les occasions pour rencontrer des scientifiques, que ce soit dans les discussions publiques comme celle-ci ou en privé, pour soulever ces questions. En particulier : « **Pourquoi faisons-nous de la recherche scientifique ?** » Une question qui est pratiquement la même peut-être, à longue échéance du moins, que la question : « Allons-nous continuer la recherche scientifique ? » La chose extraordinaire est de voir à quel point mes collègues sont incapables de répondre à cette question.'

Rediscovering the 70's

'Au début, nous pensions qu'avec des connaissances scientifiques, en les mettant à la disposition de suffisamment de monde, on arriverait à mieux appréhender une solution des problèmes qui se posent. Nous sommes revenus de cette illusion. ***Nous pensons maintenant que la solution ne proviendra pas d'un supplément de connaissances scientifiques, d'un supplément de techniques, mais qu'elle proviendra d'un changement de civilisation.*** C'est en cela que consiste le changement d'optique extrêmement important. Pour nous, la civilisation dominante, la civilisation industrielle, est condamnée à disparaître en un temps relativement court, dans peut-être dix, vingt ou trente ans... une ou deux générations, dans cet ordre de grandeur ; parce que les problèmes que pose actuellement cette civilisation sont des problèmes effectivement insolubles. Nous voyons maintenant notre rôle dans la direction suivante : être nous-mêmes partie intégrante d'un processus de transformations, de ferment de transformations d'un type de civilisation à un autre, que nous pouvons commencer à développer dès maintenant. Dans ce sens, le problème de la survie pour nous a été, si l'on peut dire, dépassé, il est devenu celui du problème de la vie, de la transformation de notre vie dans l'immédiat ; de telle façon qu'il s'agisse de modes de vie et de relations humaines qui soient dignes d'être vécus et qui, d'autre part, soient viables à longue échéance et puissent servir comme point de départ pour l'établissement de civilisations post-industrielles, de cultures nouvelles.'

What are the directions, now ?

- Hard to imagine a post-industrial and anti-science civilisation *à la Grothendieck...*
- Which scale(s) for action ? (local to worldwide)
- What role do scientists play ?
- Which political regime do we wish ?
-

Face à l'urgence climatique, les scientifiques doivent réduire leur impact sur l'environnement

TRIBUNE Un collectif de chercheurs de diverses disciplines, Labos1point5, a été créé pour promouvoir des pratiques de recherche plus sobres et contribuer autre éthique de la recherche

Avec plusieurs dizaines d'années d'expériences dans le secteur de la recherche, nous sommes convaincus que l'écologie et le développement durable sont deux piliers fondamentaux pour assurer la survie de notre planète. C'est pourquoi nous avons décidé de nous associer pour promouvoir une culture de recherche plus respectueuse de l'environnement et pour encourager les chercheurs à adopter des pratiques de recherche plus durables. Nous croyons fermement que la recherche doit être un moyen de faire face aux défis mondiaux et de contribuer à la transition vers un futur plus durable. C'est pourquoi nous avons créé Labos1point5, un collectif de chercheurs de diverses disciplines qui se sont donné comme objectif de promouvoir des pratiques de recherche plus respectueuses de l'environnement et de contribuer à la transition vers un futur plus durable. DÉBATS • MÉGABASSINES

—
TRIBUNE

Collectif

« Les mégabassines sont une mal-adaptation aux sécheresses présentes et à venir »

Le déploiement de ces retenues à ciel ouvert menace la préservation de l'eau et freine la transformation de notre modèle socio-économique et de nos modes de vie, affirment dans une tribune au « Monde », des membres du collectif Scientifiques en rébellion.

Publié le 26 mars 2023 à 16h00, modifié le 30 mars 2023 à 11h42 | ⏲ Lecture 4 min.

Quelle est donc l'utilité réelle des bassines, « greenwashing hydrologique » où l'argent public bénéficie à un petit nombre au détriment de tous les autres ? L'éthique scientifique nous impose de susciter et d'éclairer un débat démocratique, pour que soient prises des décisions collectives à la hauteur des enjeux. Les mobilisations contre les projets de mégabassines nous paraissent légitimes, et les Scientifiques en rébellion estiment nécessaire d'agir pour replacer les débats scientifiques et la gestion des ressources au cœur d'une prise de décision égalitaire entre tous les acteurs.

¶ Liste des signataires : **Sylvain Kuppel** (hydrologie), **Odin Marc** (géomorphologie), **Stéphanie Mariette** (génétique des populations), **Laurent Lassabatère** (hydrologie), **Pascal Houillier** (médecin, physiologie), **Julien Lefèvre** (informatique), **Lara Elfjiva** (anthropologie sociale), tous membres du collectif Scientifiques en rébellion, qui réunit des scientifiques de toutes disciplines, mobilisés contre l'inaction face au dérèglement climatique et à l'effondrement de la biodiversité.

Non Violent Civil Disobedience

- « Simple » solution :
 - Targets are obvious (fossil fuel companies...)
 - More and more accepted (~ 50 % of scientists willing to participate, according to <https://osf.io/preprints/psyarxiv/73w4s>)
 - More and more documented and scientifically studied (Bennett et al, Lancet, 2020 ; Racimo et al, Elife, 2022...)
- But :
 - Outside France, risks can be high (R. Abramoff in USA)
 - Requires to be clear with notions such as neutrality
 - Be carefull with authority positionning (same as « merchants of doubts »)

Neutrality and science

- « *As a researcher, the idea of being separated from the real world is just an illusion. I need money for myself, my grants. I belong to a scientific community with issues of influence, power etc.* »
- Realizing the sociological component of science, one can try to identify structuring forces, **values** (= what is desirable or influent in our field) that are **epistemic** or **contextual** and how they can be influenced mutually (see T. Kuhn, H. Longino, L. Coutellec).

Examples : preciseness, simplicity, efficiency... (epistemic)

equity, justice, transparency... (contextual)

efficiency can be both (see later)...

Neutrality and science

« Scientific statements are distinguished from other discourses by the requirement to take account of the facts, without distorting them, which presupposes **being aware of the insidious ways in which our values and interests can bias our view of the world**. This is Weber's ideal of **axiological neutrality**. It therefore concerns the research process itself, centered on fact-finding and analysis. But upstream, Weber acknowledges **the role of values in the selection of problems** deemed worthy of study, and downstream, he recognizes the right of scientists to defend their convictions in the public arena. On the other hand, **it considers that academics should refrain from doing so in the context of their academic activities**, as students do not have the same right to speak as they do. The extent to which we have moved away from this demanding and nuanced concept: by taking for granted the neutrality we're trying to achieve, we are depriving ourselves of the **reflexivity** we need to attain it. »

A. Berlan, Comment l'idée de neutralité scientifique nous aveugle, 2023

<https://doi.org/10.1016/j.patter.2021.100340>

THE BIGGER PICTURE To avoid catastrophic consequences from climate change, all sectors of the global economy, including *Information Communication Technology (ICT)*, must keep their greenhouse gas (GHG) emissions in line with the Paris Agreement. We examine peer-reviewed estimates of ICT's GHG emissions, which put ICT's share of global GHG emissions at 1.8%–2.8%. We find pronounced differences and much debate concerning the underlying assumptions behind the peer-reviewed studies, which could suggest that global emissions from ICT are as high as 2.1%–3.9%. All study analysts agree that ICT emissions *will not reduce* without major concerted political and industrial efforts, and we provide three reasons for anticipating that ICT emissions are actually going to *increase* without intervention. Our analysis suggests not all ICT carbon pledges are ambitious enough to meet climate targets, and that policy mechanisms for enforcing sector-wide climate target compliance are lacking. Without a global carbon constraint, sector-wide regulations are required to keep ICT's carbon footprint aligned with the Paris Agreement. With a global carbon constraint, ICT would be a greater enabler of productivity and utility, creating opportunity for the sector to be financially successful as a critical part of a global net zero society.

4 % of global GHG
Rapid increase ~9 % /year

Narratives of ICT's role in climate change

Enablement

ICT allows for efficiency improvements in other sectors and thereby enables emissions savings that are bigger than its own emissions and bigger than any rebound effects.

ICT's net effect is to reduce emissions in the world.

e.g. GeSI

Global Jevons Paradox

The efficiency improvements enabled by ICT in other sectors lead to system growth. Rebound effects are larger than the efficiency gains.

ICT's net effect is to increase emissions in the world.

e.g. Sorrell

VOTRE BROSSE À DENTS VOUS ESPIONNE

Un capitalisme de surveillance

L'industrie numérique prospère grâce à un principe presque enfantin : extraire les données personnelles et vendre aux annonceurs des prédictions sur le comportement des utilisateurs. Mais, pour que les profits croissent, le pronostic doit se changer en certitude. Pour cela, il ne suffit plus de prévoir : il s'agit désormais de modifier à grande échelle les conduites humaines.

AI and/or environment

- Literature in ML/DL suffers from biases (techno-optimism) or ignorance
 - Analysis of ~ 60 articles with applications in transportation, smart cities
 - No mention of negative impacts in terms of GHG emissions
- No clear methodology in the community of AI to assess the pros and cons of a new technology for environment.

Unraveling the Hidden Environmental Impacts of AI Solutions for
Environment Life Cycle Assessment of AI Solutions

by  Anne-Laure Ligozat ^{1,*}   Julien Lefevre ²   Aurélie Bugeau ³  and  Jacques Combaz ⁴ 

AI and/or environment

- Impacts need to be more quantified, not only GHG emissions (LCA methodology, ISO 14040)
- Difficulties
 - Lack of data (industrial secret)
 - Hard to anticipate large change
 - Who will decide at the end whether a technology or product need to be deployed ?

Unraveling the Hidden Environmental Impacts of AI Solutions for
Environment Life Cycle Assessment of AI Solutions

by Anne-Laure Ligozat ^{1,*} Julien Lefevre ² Aurélie Bugeau ³ and Jacques Combaz ⁴

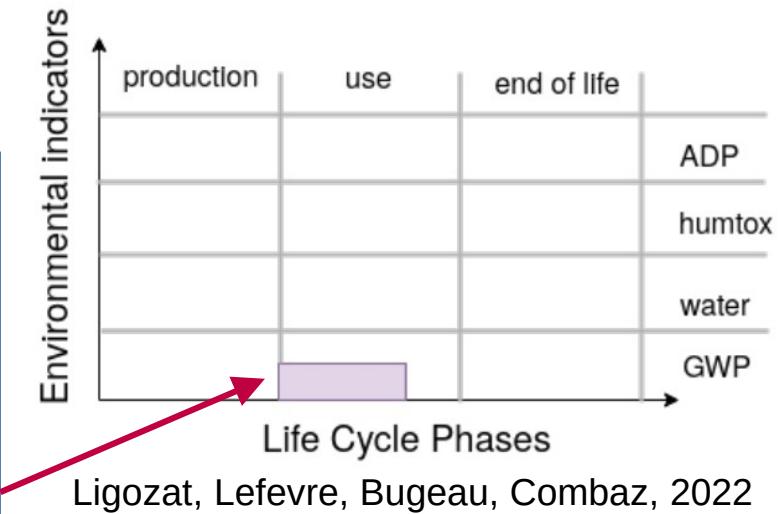

AI in the lab

- Summer 2023, 3 months internship by Nathan Lemmers (INSA)
- Several questions :
 - What is the environmental impact of AI in a neuroscience lab ? (quantitative)
 - What is the sociological impact of AI ? (qualitative)
- Underlying hypothesis and long term objectives :
 - We cannot decrease the impacts of a lab through an authoritarian action
 - We may try by engaging all the community in a reflexive approach : understanding individual and collective values, attachments, dependencies...

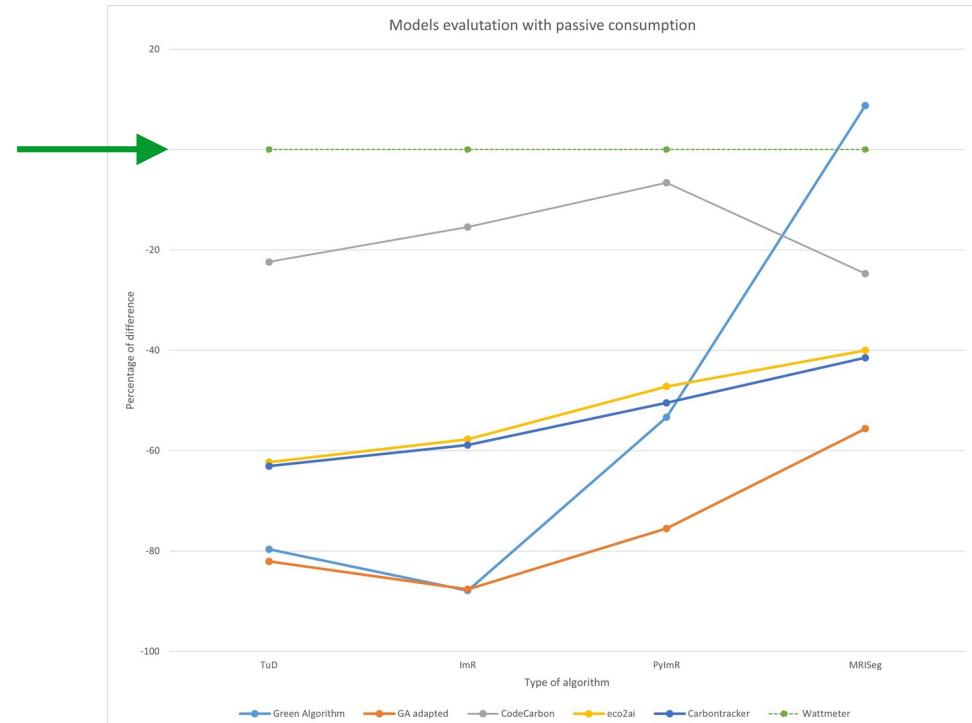

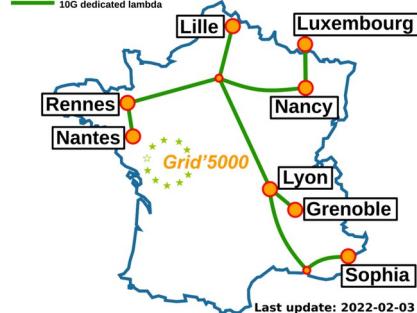

LCA for AI (Machine Learning)

- A lot of unknown impacts
- Several tools for the use phase, **mostly training** :
Code carbon, Eco2ai, Carbontracker, GreenAlgorithm...
- Methodologies vary (CPU/GPU, proxy of Energy)
- Results vary w.r.t ground truth (physical wattmeters)

Energy consumption (training)

- Comparison of 4 Tools + 1 by Nathan + wattmeters (grid5000)
- 4 algorithms

All the models underestimate passive consumption !

Qualitative study

- 7 semi-directive interviews with AI users
- 3 main axes
 - a) what use ? b) how it changed research activity ? c) what future for AI ?
- 3 main narratives:
 - ecological (“DL consumes a lot of energy”), techno-solutionist (“AI is necessary for health”), ethical (“How to conciliate privacy and openness ?”)
- Values associated to AI, following *Birhane et al, Values encoded in ML, 2022:*
 - performance, efficiency, understanding, useful, open/shareable, few resources...

Efficiency

« Machine learning currently exerts an **outsized influence** on the world, increasingly affecting institutional practices and impacted communities. It is therefore critical that we question vague conceptions of the field as **value-neutral** or **universally beneficial**, and investigate what specific **values** the field is advancing. »

- Annotation scheme for studying the values in research articles
- Applied on 100 highly cited papers (ICML, NeurIPS)
- Societal need in 15 % and negative potential in 1 % + 59 values.
- Link between universities and tech companies

The model uses less of some resource, (e.g., data, energy, label, memory, cost), is fast, or has reduced training time.

- Efficiency is commonly referenced to indicate the ability to scale up, not to save resources.
- A more efficient inference method allows you to do inference in much larger models or on larger datasets, using the same amount of resources used previously, or more (Jevon's paradox = **rebound effect**).
- 84% of papers mention valuing efficiency, but **only 15% of those value requiring few resources**.

FEATURE ARTICLE

POINT OF VIEW

Rethinking academia in a time of climate crisis

Abstract Addressing the climate crisis requires radical and urgent action at all levels of society. Universities are ideally positioned to lead such action but are largely failing to do so. At the same time, many academic scientists find their work impeded by bureaucracy, excessive competitiveness, and a loss of academic freedom. Here, drawing on the framework of "Doughnut Economics," developed by Kate Raworth, we suggest seven new principles for rethinking the norms of scientific practice. Based on these, we propose a call to action, and encourage academics to take concrete steps towards the creation of a flourishing scientific enterprise that is fit for the challenges of the 21st century.
